## 1 Description

Returns the current status of the Templeton server. Useful for heartbeat monitoring.

## 2 URL

`http://www.myserver.com/templeton/v1/status`

## 3 Parameters

Only the [standard parameters](#) are accepted.

## 4 Results

| Name           | Description   |
|----------------|---|
| <b>status</b>  | "ok" if the Templeton server was contacted.           |
| <b>version</b> | String containing the version number similar to "v1". |

## 5 Example

### Curl Command

```
% curl -s 'http://localhost:50111/templeton/v1/status'
```

### JSON Output

```
{  
  "status": "ok",  
  "version": "v1"  
}
```
